Note: The tolerable standard definition was amended by the Housing (Scotland) Act 2006 to include additional criteria, covering thermal performance and electrical safety. As the amendment was not implemented until April 2009, the results from the 2010 survey are the first to be based on the amended standard. The change in definition has caused the fail rate for the tolerable standard to increase substantially. From 2012 the House Condition Survey forms part of the wider Scottish Household Survey.

Notes: SAP ratings are energy-cost ratings determined by the government's Standard Assessment Procedure. It is an index based on calculated annual space and water heating costs for a standard heating regime expressed on a scale of 1 (highly inefficient) to 100 (highly efficient). Figures are mean averages. Figures for the small number of dwellings occupied by households living rent-free are not shown due to the small sample size, but are reflected in the all tenure figures.

Note: The EPC Bands are based on SAP ratings (shown in brackets). SAP is the Standard Assessment procedure for energy rating of dwellings. The SAP methodology changes periodically and the relevant one ('SAP 2005' etc.) is shown above the years to which it applies.

The EPC bands range from 'G' (very poor) to 'A' (highly efficient).
